

miR-1246-21's utility is described strictly as a diagnostic biomarker for breast cancer. There is no information or observed effect related to exercise physiology, training load monitoring, recovery, adaptation, overtraining, metabolic flexibility, inflammation, or any other physiological or clinical outcome. There is no direct or indirect information linking miR-1246 to exercise physiology, training load monitoring, recovery, adaptation, overtraining, metabolic flexibility, inflammation, or any other physiological or clinical outcome.
